GEORGIA INSTITUTE OF TECHNOLOGY SCHOOL of ELECTRICAL and COMPUTER ENGINEERING

ECE 2026 Summer 2021 Lab #0: Introduction to MATLAB

Date: May 17-24, 2021

This lab is either an introduction or review of MATLAB. It does not require verification.

You will need to have MATLAB installed on your computer. To install MATLAB visit: https://matlab.gatech.edu.

Pre-Lab: You should read the Pre-Lab section of the lab and do all the exercises in the Pre-Lab section *before your assigned lab time*.

Verification: The Exercise section of each lab must be completed **before your assigned Lab time** and the steps marked *Instructor Verification* must be demonstrated **during the lab time**. One of the laboratory instructors must verify the appropriate steps by signing on each step of the **Instructor Verification** worksheet within Canvas. Demonstrate each step to the TA or instructor.

Forgeries and plagiarism are a violation of the honor code and will be referred to the Dean of Students for disciplinary action. You are allowed to discuss lab exercises with other students, but you cannot give or receive any written material or electronic files. In addition, you are not allowed to use or copy material from old lab reports from previous semesters. Your submitted work must be your own original work.

1 Pre-Lab

Please read through the information below prior to attending your lab.

1.1 Overview

MATLAB will be used extensively in all the labs. The primary goal of this lab is to familiarize yourself with using MATLAB. Please read Appendix B: *M-file Programming in MATLAB* for an overview. Here are three specific goals for this lab:

- 1. Learn basic MATLAB commands and syntax, including the help system.
- 2. Write and edit your own script files in MATLAB, and run them as commands.
- 3. Learn a little about advanced programming techniques for MATLAB, i.e., vectorization.

1.2 Getting Started

After logging in, you can start MATLAB by double-clicking on a MATLAB icon, typing matlab in a terminal window, or by selecting MATLAB from a menu such as the START menu under Windows. The following steps will introduce you to MATLAB.

(a) Run the MATLAB help desk by typing helpdesk. The help desk provides a hypertext interface to the MATLAB documentation. Two links of interest are **Getting Help** and **Getting Started with MATLAB**.

- (b) One of the tabs in the Help Desk is called Demos, where you can see information on getting started and some other basics of MATLAB.
- (c) Explore the MATLAB help capability available at the command line. Try the following:

Note: it is possible to force MATLAB to display only one screen-full of information at once by issuing the command more on).

(d) **control-C** will stop the execution of any MATLAB command. For example, using **ctl-C** while lookfor is running will force it to stop and print out all the results it has found so far.

1.3 Calculate and Plot

(a) Use MATLAB as a calculator. Try the following:

(b) Do variable name assignment in MATLAB. Try the following:

(c) Complex numbers are natural in MATLAB. The basic operations are supported. Try the following:

(d) Plotting is easy in MATLAB for both real and complex numbers. The basic plot command will plot a vector y versus a vector x. Try the following:

Use help arith to learn how the operation xx.*xx works when xx is a vector; compare array multiplication (dot-star) to matrix multiplication. When unsure about a command, use help.

2 Exercise

For the instructor verification, you will have to demonstrate that you understand things in a given subsection by answering questions from your lab instructor (or TA). It is not necessary to do everything in the subsections, i.e., skip parts that you already know. The Instructor Verification is usually placed close to the most important item, i.e., the one most likely to generate questions from the TAs.

2.1 MATLAB Array Indexing

(a) Make sure that you understand the **colon** notation. In particular, explain in words what each of the following MATLAB statements will produce (array length and values):

```
jkl = 0 : 6
nnn = 2 : 4 : 17
mmm = 99 : -1 : 88
ttt = 2 : (1/9) : 4   %<--- How many elements in the ttt vector?
<math>tpi = pi * [ 0:0.1:2 ];
```

(b) Extracting and/or inserting numbers in a vector is very easy to do. Consider the definition of xx in the first line:

```
xx = [ zeros(1,3), linspace(0,1,5), ones(1,4) ]
xx(4:6)
size(xx)
length(xx)
xx(2:2:length(xx))
```

Explain the results echoed from each of the last four lines of the above code.

(c) Observe the result of the following two assignments, where xx was defined in part (b):

```
xx = [ zeros(1,3), linspace(0,1,5), ones(1,4) ];
yy = xx;
yy(4:6) = exp(1)*(1:3)
```

Now write a statement that will take the vector xx and replace the even indexed elements (i.e., xx(2), xx(4), etc) with the constant π^e . Use a vector replacement, not a loop.

```
Instructor Verification (separate page)
```

2.2 MATLAB Array Operations

There are two kinds of multiplication in MATLAB: matrix multiplication and *array* multiplication. Many other operations such as division and exponentiation also have this dual character. MATLAB uses a period to change the behavior from a matrix operator to an array operator, e.g., dot-star (.*) instead star (*) for multiplication.

(a) The default is matrix multiplication when the "*" symbol is used; execute the following:

```
AA = [ 1, 2; 3, 4; 5, 6; 7, 8]
BB = [ 1, 2, 3; 4, 5, 6]
CC = AA * BB
DD = BB * AA
```

Explain why one of the multiplications fails. In the case where the multiplication succeeds, explain what the dimensions of the resulting product matrix will be.

(b) In DSP it is often useful to perform an *element-by-element* multiplication, which we will call array multiplication. For example, to multiply one sinusoid by another we would use the ".*" operator:

```
nn = 1:9;
qq1 = 7*cos(0.1*pi*nn-pi/2); qq2 = cos(pi*nn);
qq = qq1 .* qq2
zz = qq1 * qq2
```

Explain why the multiplication that attempts to create zz fails. Notice that the dimensions of the array-product matrix qq are the same as the dimensions of nn. Explain the values in the vector qq2.

Instructor Verification (separate page)

2.3 MATLAB Script Files

(a) Experiment with vectors in MATLAB. Think of the vector as a list of numbers. Try the following:

```
xk = cos(pi*(0:11)/4); %<---comment: compute cosines
```

How many values of the cosine are stored in the vector xk? What is xk(1)? Is xk(0) defined? *Notes:* the semicolon at the end of a statement will suppress the echo to the screen. The text following the % is a comment; it may be omitted.

(b) (A taste of vectorization) Loops can be written in MATLAB, but they are NOT the most efficient way to get things done. It's better to <u>always avoid loops</u> and use the colon notation instead. The following code has a loop that computes values of the cosine function. *Note:* the index of cc() must start at 1.

```
cc = [];  %<--- initialize the cc vector to be empty for k=-50:50   cc(k+51) = cos(pi*k/30); end plot(cc)
```

Explain why it is necessary to write cc(k+51) inside the loop. What happens if you use cc(k) instead? Also, explain the labels on the x-axis of the plot.

- (c) **Rewrite the computation in the previous without using the loop** by following the style in part (a). Two MATLAB statements plus the plot command should suffice.
- (d) Use the built-in MATLAB editor to create a script file¹ called mylab0.m containing the following lines:

```
tt = -5 : 0.01 : 10;
xx = cos( 0.5*pi*tt );
zz = 0.6*exp(-j*pi/4)*exp(j*0.5*pi*tt);
%
%<-- plot the real part, which is a sinusoid
plot( tt, xx, 'b-', tt, real(zz), 'r--' ), grid on
title('Test Plot of a TWO sinusoids')
xlabel('Time (sec)')</pre>
```

Explain why the plot of real(zz) is a sinusoid. Determine its phase (φ) and amplitude (A) from

¹Use the MATLAB command addpath() to allow MATLAB to "see" your personal directory (usually the C: drive).

its definition. Make a calculation of the phase from a time-shift measured on the plot; zoom in to measure a peak location very accurately. Compare this value to the expected value from the formula that defines zz.

Instructor Verification (separate page)

(e) Run your script from MATLAB. To run the file mylab0 that you created previously, try
